PRODUCT INFORMATION

Ultraviolet germicidal irradiation (UVGI) technologies from UVDI prevents microbial growth on hospital cooling coils. In healthcare environments the presence of any microbial pathogens can lead to potentially deadly infections. Those most at risk are people with compromised immune systems. Hospital Infection Control Officers and Facility Managers concerned about the growth of microbial pathogens on cooling coils are specifying UV-C coil treatment systems to disinfect the coils. UVDI's line of products are designed to accomplish this important task and teamed with Solutions Group installation you have a single source solution.
